# WHAT IS TELECOMMUNICATION?

Telecommunication is the transmission of signs, signals, messages, words, writings, images and sounds or information of any nature by wire, radio, optical or other electromagnetic systems. Telecommunication occurs when the exchange of information between communication participants includes the use of technology. It is transmitted either electrically over physical media, such as cables, or via radiation. Such transmission paths are often divided into different communication channels which afford the advantages of multiplexing. Since the Latin term communication is considered the social process of information's exchange, the term telecommunications is often used in its plural form because it involves many different technologies.
